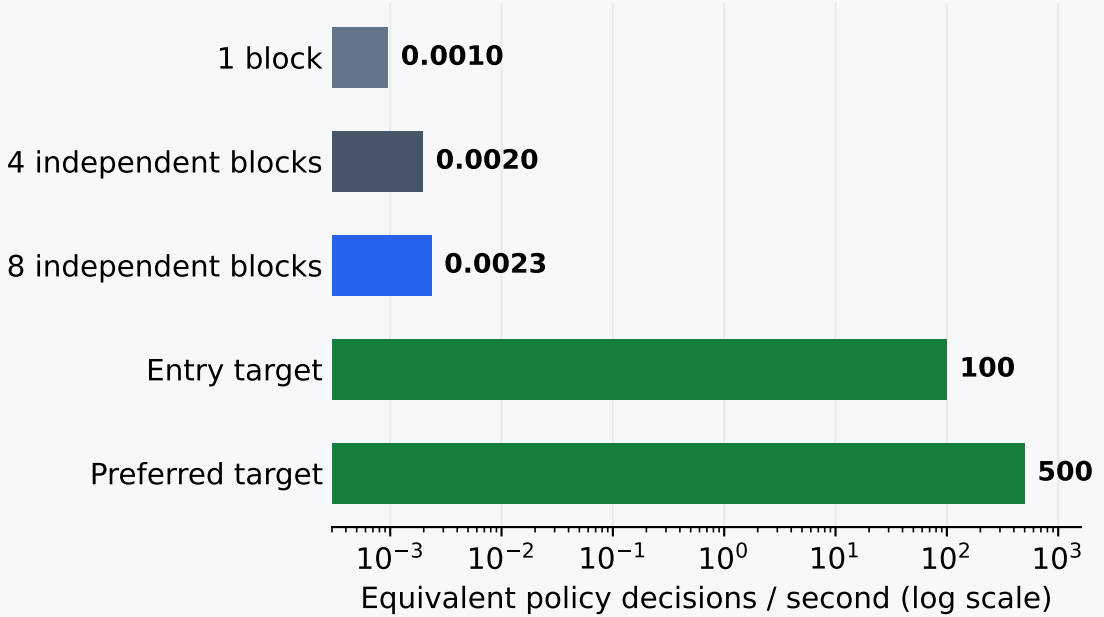
Performance decision: keep this solver as a reference, not the RL engine

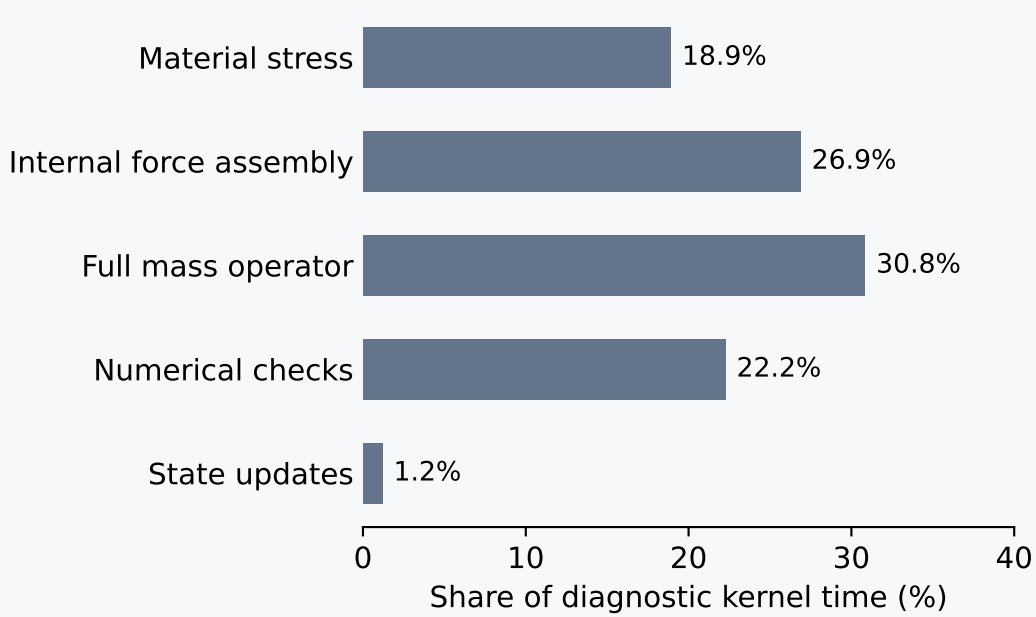
Best tested batch is about 42,556× below the entry target. Existing Isaac/DiSECt setup unchanged.

Even the optimistic bulk-only rate is far below target



50 Hz control assumed. Fixed-topology microbenchmarks; no contact, fracture, robot, rendering or policy overhead.

The cost is in the mechanics



One partially cut block, 32 profiled microsteps. The verified timestep is 24.4 nanoseconds.
